AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for disgnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-JUL-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                       Claim 3; Page -; 178pp; English.

           highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are
                                                                                                                                                                                                                                                                                                                                                                                 31-JUL-1995;

                             nighly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are
                                                                                                                                                                                                                                                                                                                                                                              31-JUL-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                          AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a clifferent wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural compactific common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial common factor as cerebral containing antisense sequences, antibodies selective for these mutant common for the proteins and modulators of PS gene expression are cuseful as models for drug screening. The antibodies can also be used e.g. common factor affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                      AAW05736-W05760 represent mutated versions of the human presenilin-1-1 cprotein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial capot regions, Mutations in PS genes are implicated in familial chaemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type sequences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity 100 Matches 15; Conservative

                                                                                                                                                                                                                                                       AAW05736-W05760 represent mutated versions of the human presenilin-1-1 correction (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presentints are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type sequences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                              splicing of the genomic DNA sequence. The presentiins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing anticons company.
                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                      containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New presentiin genes - useful for diagnosis, therapy and drug screening of familial Alzheimer's disease, cerebral disorders,

                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                            AAW05733 and AAW05734 represent the two different forms of wild type CC human presentilin-1 (PS-1). The form represented by AAW05734 results from CC alternate splicing of the genomic DNA sequence. AAW05762 represents the CC coding sequence for wild type human PS-2. The presentilins are a family of highly conserved integral membrane proteins with a common structural CC motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial CC Alzheimer's disease (AD) and possibly other diseases such as cerebral CC haemorrhage, schizophrenia, depression etc., so detection of mutations in CC the DNA encoding these sequences can be used for diagnosis of these CC diseases. These proteins, or vectors that express them or containing CC antisense sequences, antibodies selective for mutant forms of these CC potentially useful for treatment of AD etc. Transgenic animals are useful CC as models for drug screening. The antibodies can also be used e.g. for CC affinity purification and in immunoassays.
                                                                                                                                                                                                                                                              Query Match

This sequence represents the wild type murine presentlin-1.

CC AAW05733 and AAW05734 represent the two different forms of wild type
CC human presentlin-1 (PS-1). The form represented by AAW05734 results from
CC alternate splicing of the genomic DNA sequence. AAW05762 represents the
CC coding sequence for wild type human PS-2. The presentlins are a family
CC of highly conserved integral membrane proteins with a common structural
CC spot regions. Mutations in PS genes are implicated in familial
CC Alzheimer's disease (AD) and possibly other diseases such as cerebral
CC the DNA encoding these sequences can be used for diagnosis of these
CC diseases. These proteins, or vectors that express them or containing
CC antisense sequences, antibodies selective for mutant forms of these
CC potentially useful for treatment of AD etc. Transgenic animals are useful
CC as models for drug screening. The antibodies can also be used e.g. for
CC affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Presenilin-1; mouse; hPS1-1; hPS1-2; PS-2; integral membrane protein; AD; familial Alzheimer's disease; cerebral haemorrhage; schizophrenia; depression; antibody; gene expression modulator; therapy.

                                                                                                                                                                                                                                                                                           highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations ithe DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g

AAW05736-W05760 represent mutated versions of the human presenilin-1-1 CC protein (see AAW05733 for wild type sequence). AAW05734 represents a CC different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural cc motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial CC Alzheimer's disease (AD) and possibly other diseases such as cerebral chaemorrhage, schizophrenia, depression etc., so detection of mutations in CC the DNA encoding the wild type sequences can be used for diagnosis of the pank encoding the wild type spences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant CC containing antisense sequences, antibodies selective for these mutant corrections of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. for earlier and in immonsease.

AAW05734 represents a CC different wild type form of presenilin-1 that results from alternate cC different wild type form of presenilin-1 that results from alternate cC splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural cC motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial CC Alzheimer's disease (AD) and possibly other diseases such as cerebral can be encoding the wild type sequences can be used for diagnosis of the DNA encoding the wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant C forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC AAW05736-W05760 represent mutated versions of the human presenilin-1-1 CC protein (see AAW05733 for wild type sequence). AAW05734 represents a CC different wild type form of presenilin-1 that results from alternate CC splicing of the genomic DNA sequence. The presenilins are a family of CC highly conserved integral membrane proteins with a common structural CC motif, common alternate splicing patterns, and common mutational hot Spot regions. Mutations in PS genes are implicated in familial CC Alzheimer's disease (AD) and possibly other diseases such as cerebral CC haemorrhage, schizophrenia, depression etc., so detection of mutations in CC the DNA encoding the wild type proteins, or vectors that express them or CC containing antisense sequences, antibodies selective for these mutant CC forms of the proteins and modulators of PS gene expression are CC useful as models for drug screening. The antibodies can also be used e.g. CC for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-JUL\1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW05736-W05760 represent mutated versions of the human presentiin-1-protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presentiin-1 that results from alternate splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural highly conserved integral membrane proteins with a common structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (HSCR-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC AAW05736-W05760 represent mutated versions of the human presentlin-1-1 CC protein (see AAW05733 for wild type sequence). AAW05734 represents a CC different wild type form of presentlin-1 that results from alternate CC splicing of the genomic DNA sequence. The presentlins are a family of theylory conserved integral membrane proteins with a common structural CC motif, common alternate splicing patterns, and common mutational hot CC spot regions. Mutations in PS genes are implicated in familial CC Albheimer's disease (AD) and possibly other diseases such as cerebral CC haemorrhage, schizophrenia, depression etc., so detection of mutations in CC the DNA encoding the wild type sequences can be used for diagnosis of the DNA encoding the wild type sequences can be used for diagnosis of CC containing antisense sequences, antibodies selective for these mutant CC forms of the proteins and modulators of PS gene expression are containing setup in the antibodies can also be used e.g. creatial as models for drug screening. The antibodies can also be used e.g. for infinity murification and in immunoassave.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations it the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g

AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New presentlin genes - useful for diagnosis, therapy and drug screening of familial Alzheimer's disease, cerebral disorders, etc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type sequences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW05736-W05760 represent mutated versions of the human presenilin-1-1 crosses of see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral hemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of the DNA encoding the wild type sequences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein (see AAW05733 for wild type sequence). AAW05734 represents a clifferent wild type form of presentilin-1 that results from alternate splicing of the genomic DNA sequence. The presentilins are a family of chighly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial CC Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosts of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.g. or or affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzhelmer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural

The presenilins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g
AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural

           The present sequence represents the human mutant S182 gene, PS1, product. Mutant PS1 produces a gene product that increases the probability of Alzheimer's disease. A nucleic acid sequence able to hybridise to sequences coding for a mutant PS1 polypeptide can be used as probes for diagnosing an increased likelihood of contracting Alzheimer's disease. Antibodies against the mutant polypeptide can also be used for this purpose. Vectors containing or expressing a nucleic acid molecule, protein or antibody specific for mutant PS1 can be administered to a patient to reduce the likelihood, or delay the onset, of Alzheimer's disease, e.g. anti-sense RNA expression can be used to decrease expression of the PS1 peptide. Transgenic animals expressing the Alzheimer's disease protein can be used to test candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                    Chromosome 14 early-onset familial Alzheimer's disease gene PS1 mutants - useful for diagnosing likelihood of developing Alzhei disease, also anti-sense sequences, antibodies and vaccines to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                       The present sequence represents the human S182 gene, PS1 locus, product. Mutant PS1 produces a gene product that increases the probability of Alzheimer's disease. A nucleic acid sequence able to hybridise to sequences coding for a mutant PS1 polypeptide can be used as probes for diagnosing an increased likelihood of contracting Alzheimer's disease. Antibodies against the mutant polypeptide can also be used for this purpose. Vectors containing or expressing a nucleic acid molecule, protein or antibody specific for mutant PS1 can be administered to a patient to reduce the likelihood, or delay the onset, of Alzheimer's disease, e.g. anti-sense RNA expression can be used to decrease expression of the PS1 peptide. Transgenic animals expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-AUG-1996;

A 463-amino acid polypeptide (AAW11840) is the product of another full-length cDNA (AAT59536) of an EOAD splice variant gene. The 2 polypeptides can be produced in transformed host cells and used to raise antibodies, or to identify antagonist/inhibitor cpds., useful in the treatment of Alzheimer's

                                                                                                         and epilepsy. Use of the nucleur during any particles and diagnosing derived from the presentlins is made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD. Methods for identifying substances that bind to, or
                                                                                                                                                                                                                                                                                                      This polypeptide comprises human presentlin-1 (hPS1). Its amino acid sequence was deduced from an isolated cDNA clone (see AAV04666). Another hPS1 sequence (see AAW23965) results from alternative splicing of the hPS1 mRNA transcript. A murine PS1 homologue (see AAW23966) and a human presentlin-2 protein (see AAW23967) are also provided. Mutations in the PS-1 and PS-2 genes are linked to the development in humans of forms of familial Alzheimer's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises the murine presentlin-1 (PS1) homologue. CITs amino acid sequence was deduced from an isolated cDNA clone (see AAV04668). Mutations in the human PS1 and PS2 genes (see AAV04666-68) have been linked to the development in humans of forms of familial alzheimer's disease (FAD). All amino acids that are mutated in analysed FAD pedigrees (see AAW23964) were conserved in the murine homologue. Use of the nucleic acids and proteins comprising or derived from presentlins can be made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD. Methods for identifying substances that bind to, or modulate the activity of a presentlin protein, and methods for identifying substances that affect the interaction of a presentlin-interacting protein with a presentlin or protein are also disclosed.
                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Crisis sequence is the PS1/467 presentlin peptide. This sequence is CC specifically stated as not being in the nucleic acid of the invention, CC which encodes the PS1/429 presentlin peptide PS1/429 (II). Cells CC transformed with the DNA are used to produce recombinant (II) and CC analogues, useful e.g. as immunogens for generating an immune response against PS1/429. (II) is a new product of the PS1 gene, mutations in CC which cause Alzheimer's disease (AD). The nucleic acids are generally CC useful as probes for detection and quantification of PS1/429, and CC particularly for diagnosis of AD, especially the target sequences that CC particularly for diagnosis of AD, especially the target sequences that CC particularly for diagnosis are isolated for sequencing. Antibodies (Ab) can also be used to identify epitopes and for affinity purification of CC also be diagnosed at the protein level using Ab as immunoassay reagents. CC Ab can also be used to identify epitopes and for affinity purification of CC of the PS1/429 gene, and both nucleic acids and peptides are useful as size markers in electrophoresis, chromatography etc. The transgenic computation are used as models for AD, e.g. for testing drugs. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. Ab or diseases involving mitochondrial pathology, apoptosis and neurodegeneration. CC Typical regulators are antisense sequences, ribozymes, aptamers, CC synthetic or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC specifically stated as not being in the nucleic acid of the invention, cwhich encodes the PS1/429 presentlin peptide PS1/429 (II). Cells children encodes the PS1/429 presentlin peptide PS1/429 (II) cells contained with the DNA are used to produce recombinant (II) and canalogues, useful e.g. as immunogens for generating an immune response against PS1/429. (II) is a new product of the PS1 gene, mutations in CC which cause Alzheimer's disease (AD). The nucleic acids are generally cuseful as probes for detection and quantification of PS1/429. (CO particularly for diagnosis of AD, especially the target sequences that CC hybridise with probes are isolated for sequencing. Antibodies (AD) can calso be diagnosed at the protein level using Ab as immunoassay reagents. Ab can also be used to identify epitopes and for affinity purification of peptides. Antisense nucleic acid may also be used to regulate expression compounds are used as models for AD, e.g. for testing drugs. Regulators of the PS1/429 gene, and both nucleic acids and peptides are useful as compounds are used as models for AD, e.g. for testing drugs. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. AD or diseases involving mitochondrial pathology, apoptosis and neurodegeneration. CC synthetic or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mutant presentilin gene. The mutant presentlin gene causes amino acid substitutions at 1 or more positions of 79, 82, 96, 115, 120, 135, 139, 143, 146, 163, 209, 213, 231, 235, 246, 250, 263, 264, 267, 269, 280, 285, 286, 290, 318, 384, 392, 410, 426 and 436, with corresponding N-terminals being e.g. A79V, V82L, A426 and P436S, particularly by replacing isoleucine of position 213 by another amino-acid especially threonine. The gene mutant animals e.g. mice can be used as model animals for the study of human Alzheimer's diseases and to screen and evaluate substances as candidates for prevention and/or therapy of Alzheimer's diseases in patients. They can over-produce amyloid beta protein by the presention-1 gene to cause nerve cell death or pathologically close to human patients with Alzheimer's diseases. The pathologically close to human patients with Alzheimer's diseases. The
                                                                                                                                                                                                                    Mutant presenilin-1 gene-introduced animals, useful as model animals for study of Alzheimer's diseases in human and screening substances for prevention and/or treatment of the diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-JAN 1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
```

The present invention describes a gene mutant animal having a non-human mutant presentilin gene. The mutant presentilin gene causes amino acid substitutions at 1 or more positions of 79, 82, 96, 115, 120, 135, 139, 143, 146, 163, 209, 213, 231, 235, 246, 250, 260, 263, 264, 267, 269, 280, 285, 286, 290, 318, 384, 392, 410, 426 and 436, with corresponding

                                                                                          The present sequence represents wild type human presenilin 1 (PS1) protein. The specification describes a method for identifying substances that alter the interaction of a presenilin with a presentlin-binding protein. The method comprises contacting the interacting domain of a presenilin protein to a presenilin-binding protein in the presence of a test substance, and measuring the interaction of the presenilin and the presenilin-binding protein. The method can be used to screen individuals for presentlin alleles associated with Alzheimer's disease and related disorders, such as senile dementia's, psychiatric diseases such as schizophrenia and depression, and neurological disease, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-terminals being e.g. A79V, V82L, A426 and P436S, particularly by replacing isoleucine of position 213 by another amino-acid especially threonine. The gene mutant animals e.g. mice can be used as model animals for the study of human Alzheimer's diseases and to screen and evaluate substances as candidates for prevention and/or therapy of Alzheimer's diseases in patients. They can over-produce amyloid beta protein by the presentiin-1 gene to cause nerve cell death or peeling off in the hippocampus earlier. Such animals are being pathologically close to human patients with Alzheimer's diseases. The present sequence represents mouse presentlin-1, as given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure;

                                                                                  The present sequence represents a human presentlin I (PSI) polypeptide. Human Neural Plakophilin Related Armidillo Protein (hNPRAP) polypeptide is known to interact with PSI and PS2. The specification describes a method for stimulating the growth of nerve cells, comprising contacting them with hNPRAP. The hNPRAP polypeptide and polynucleotide are useful for treating nerve damage caused by a variety of diseases or physical traumas, including Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis (ALS), multiple sclerosis, stroke, ischemia associated with stroke, neural paropathy, motor neuron diseases, sciatic crush, peripheral neuropathy, neuropathy associated with diabetes, spinal cord injuries and facial nerve crush.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for identifying modulators of presentlin and catenin p120. Modulators of catenin p120 and presentlin are useful for the treatment and prophylaxis of disorders that is responsive to modulation of presentlin/catenin p120 activity. In particular, neuronal disorders such as cognitive disorders and neurodegenerative diseases such as Alzheimer's disease. Catenin p120 DNAs are useful for identifying mutations in catenin p120 genes. Identification of such mutations assist in the diagnosis of or susceptibility to Alzheimer's or other conditions associated with presentlin and in assessing the physiology of such disorders. Catenin p120 DNAs are also used in hybridisation studies to monitor expression of p120 genes and in particular for up or down regulation of catenin p120 expression. The present sequence is human presentlin-1 (PS-1) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying presentilin or catenin p120 activity modulator useful modulating presentilin-catenin p120 interaction and thus for treat cognitive disorder e.g., Alzheimer's disease comprises enhancing cognitive function -
                                                                                                                                                                                                                               AAG63936 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09-MAR-2001; 2001WO-GB01059.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13-SEP-2001.

KIAA0253 binds to presentlin. The specification describes a method of identifying a modulator of presentlin function or KIAA0253 function. The method comprises determining presentlin activity or KIAA0253 activity in the presence and absence of a test compound, where presentlin activity is determined by its ability to bind to KIAA0253. A modulator of presentlin or KIAA0253 polypeptide is useful in the manufacture of a medicament for the treatment or prophylaxis of Alzheimer's disease. The KIAA0253 polynucleotide and KIAA0253 polypeptide are useful in the treatment, prophylaxis or diagnosis of Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human Par-4 protein, presenilin protein (PS1 and PS2) and their corresponding DNA molecules. The invention also relates to a method for identifying inhibitors of neuronal degeneration, comprising cotransfecting eukaryotic host cells expressing presentlin (PS), with a Par-4 DNA, and an NF-kappa B dependent reporter construct, exposing the cotransfected cells to a candidate molecule and monitoring the ability of the candidate molecule to induce NF-kappa B activation. Presentlin proteins participates in nuclear factor kappa B (NF-kappa B) signalling and activation. The inhibitors of neuronal degeneration are useful for treating neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and also for treating neurodegeneration and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the proteins and the prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treating peripheral neuropathies, motorneuron disorders such as amyotrophic lateral sclerosis (ALS), Bell's palsy and various conditions involving spinal muscular atrophy and paralysis. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc relates to a method for identifying inhibitors of neuronal degeneration, cc comprising cotransfecting enkaryotic host cells expressing presentlin cc (PS), with a Par-4 DNA, and an NF-kappa B dependent reporter construct, cc exposing the cotransfected cells to a candidate molecule and monitoring ct the ability of the candidate molecule to induce NF-kappa B activation. Cc Presentlin proteins participates in nuclear factor kappa B (NF-kappa B) cc signalling and activation. The inhibitors of neuronal degeneration care useful for treating neurodegenerative disorders such as Alzhelmer's cdisease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and also for treating peripheral neuropathies, motorneuron disorders such as cc amyotrophic lateral sclerosis (ALS), Bell's palsy and various conditions in human presentlin psl-FAD (familial Alzheimer's disease) mutant. Cc Note: This sequence is not shown in the specification but is derived from chuman presentlin (PSI) protein [SEQ ID NO: 4] shown in page 60-61 of the specification (AAE05466).

                                                                                                                                                                                                                                                                                                                                                                                     Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human Par-4 protein, presentlin protein (PS1 CC and PS2) and their corresponding DNA molecules. The invention also CC relates to a method for identifying inhibitors of neuronal degeneration, CC comprising cotransfecting eukaryotic host cells expressing presentlin (CC exposing the cotransfected cells to a candidate molecule and monitoring CC exposing the cotransfected cells to a candidate molecule and monitoring CC the ability of the candidate molecule to induce NF-kappa B activation. CC Presentlin proteins participates in nuclear factor kappa B (NF-kappa B) signalling and activation. The inhibitors of neuronal degeneration CC are useful for treating neurodegenerative disorders such as Alzheimer's CC disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's CC treating peripheral neuropathies, motorneuron disorders such as CC treating peripheral neuropathies, motorneuron disorders such as CC amyotrophic lateral sclerosis (ALS), Bell's palsy and various conditions in human presentlin PSI-FAD (familial Alzheimer's disease) mutant. CC Note: This sequence is not shown in the specification but is derived from chaman presentlin (PSI) protein (SEQ ID NO: 4) shown in page 60-61 of the CC specification (AAE05466).
                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the sel-12 gene from Caenorhabditis elegans operably linked to a heterologous DNA sequence encoding a protein of interest. The sequence has be used to develop drugs for the treatment, prevention or delay of a neuronal disorder. In particular, the neuronal disorder may be familial Alzheimer's disease. The present sequence is a presentlin protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated DNA molecule comprising promoter of the sel-12 gene from Caenorhabditis elegans operably linked to heterologous gene, direct expression in neural cells and is useful to develop drugs to treat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              therapeutic applications in treating humans or animals, for treating a host suffering from a condition associated with an interaction between IIK and PS1, activity of PKB, activity of gamma-secretase, apoptosis, cancer and Alzheimer's disease. The agent is also useful for manufacturing a medicament for use in treatment of the above mentioned conditions. The present sequence represents human presenilin-1, PS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             included are the method above where the components are protein kinase beta (PKB), gamma secretase or their functional variants, test kits for carrying out the methods and an agent identified by the methods. The methods are used for identifying an agent that modulates interaction between ILK and PSI. or PKB or gamma-secretase. The agent interaction between ILK and PSI. or PKB or gamma-secretase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           components respectively, contacting the components in the presence of a test agent under conditions that in absence of the agent, would permit the components to interact and determining whether the agent is capable of modulating the interaction between the components. Mutant presenilin is also useful as a target for screening drugs useful in the treatment of pathologies associated with aberrant amyloid precursor protein processing, such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, Huntington's disease, amylotrophic lateral sclerosis, head injury disease, Picks disease, frontal lobe dementia, cerebellar degeneration, stroke, ischaemic injury and schizophrenia. A transgenic non-human animal is useful for analysing the interaction between APP and mutant presenilin-processing protease in vivo, and for screening antializheimer's disease drugs in vivo. A transgenic non-human animal is useful for analysing the interaction between APP and mutant presenilin-processing protease in vivo, and for screening antializheimer's disease drugs in vivo. The present sequence is human animal is useful for analysing the interaction between APP and mutant presenilin-processing protease in vivo, and for screening anti-
                                                                                                                                                                                                                                                           Misc-difference
                                                                                                                                                                                                                                                                                                                                                                          Misc-difference
